Abstract Title: Orthopedics Team Member Sharp Injuries: A Retrospective Evaluation

Author(s) and Department/Discipline Affiliation: Richard Gean, MD; Katie Schultz, MD; Carson Staples; Janine Smith; Li Ni, Seth Yarboro, MD (Orthopaedics)

Problem or Need Addressed by the Project/Aim Statement: The purpose of this study is to determine the circumstances under which team member injuries (TMI) are most likely to occur during orthopaedic surgery. Additionally, authors sought to evaluate relative rates of TMI in various subspecialties.

Description of measures/QI methodology or approach used in development of the interventions: This study examined Be Safe data collected in Orthopaedics from July 2019 to October 2022 across 56 TMI events. Team member injuries were defined as incidents in which a medical professional was exposed to a sharp such as a needle, wire, bone fragment, or saw. Types of team members analyzed in this study included medical students, residents, and attending physicians. Other collected details regarding the injury included orthopaedic surgery department, surgical stage, OR location (inpatient vs. outpatient), and time of day. This data was evaluated to identify trends in sharps-related injuries.

Results/Evaluation/Outcomes:

Discussion/Conclusion/Next Steps: Of the normal elective surgery hours, the 13:00 to 15:00 window was notable for increased rate of TMI. This time frame coincides with OR staff shift change and the latter portion of the elective day, which may be a contributing factor. Orthopaedic surgery resident physicians sustain TMI more often than attending physicians and a significant number of TMI events occur during closure – a portion of the case that consistently involves resident physicians and employs sharps. While all subspecialties were at risk, relative rates of
TMI for these groups will be helpful in understanding where to focus improvement efforts. Moving forward, increased awareness to prevent TMI during closure and at the end of the elective day is beneficial, especially for resident physicians.
